Launch Assessment - Executive Summary

New Product - Biscuits & Snacks - launch 2025-03-03

DEMONSTRATION: models and market data are SIMULATED. Figures illustrate the workflow and are not real-world observations.

Recommendation: Run a limited regional pilot. P(hurdle) = 83% looks favourable, but model reliability is Low (see risks), so validate demand on a small scale first.

Decision-support estimates only - not guarantees of commercial success. Values are labelled as Observed (historical data), Model estimate, or Assumption (user-entered).

Metric	Value
Commercial hurdle attainment probability [Model estimate]	83% (target profit 0 after launch costs within 26w)
Expected units 1 / 3 / 6 / 12 months [Model estimate]	24,578 / 156,609 / 415,832 / 937,199
Expected 6-month manufacturer net revenue [Model estimate]	INR 10,135,914
Expected 6-month contribution after launch costs [Model estimate]	INR 2,117,495
Unit contribution / margin [Calculated from assumptions]	10.39 / 42.6%
Break-even units (regular economics) [Calculated]	211,793
Model reliability [Validation-based]	Low (score 40)

Scenarios (6 months)

Scenario	Demand level	Units	Net revenue	After launch costs	Meets hurdle
Conservative	P10	178,132	4,341,976	-469,890	No
Base	P50	338,381	8,248,026	1,314,928	Yes
Optimistic	P90	695,000	16,940,625	5,300,787	Yes

Demand level is an empirical quantile of out-of-fold launch errors; cost (+5% / 0 / -3%) and availability (0.9 / 1 / 1) adjustments are manual assumptions.

Top risks

[medium] On held-out products the model did not beat the simple category baseline; treat point forecasts cautiously.

[medium] Out-of-sample launch totals differ from forecasts by a typical factor of exp(0.54) = x1.71.

[low] Uncertainty was calibrated on 26-week totals; 12-month ranges are likely understated.

[high] DEMO MODE: models were trained on SIMULATED data; outputs illustrate the workflow only.

Recommended next steps

Launch timing: Consider delaying launch by about 26 weeks *(model-derived, confidence Low)*

Inventory planning: Reduce the opening stock build or phase production *(model-derived, confidence Medium)*

Risk mitigation: Pilot in one region / channel before national rollout *(rule-based, confidence High)*
